## Scotland's Offshore Wind Portfolio

- **Operational - 9,60MW**
  1. Robie Hgg - 174MW
  2. Beatrice - 588MW
  3. Hylwind Scotland - 30MW
  4. Aberdeen Offshore Wind Farm - 93MW
  5. Kincaidine - 68MW
  6. Levenmouth Turbine - 7MW
- **Partially Operational - 950MW**
  7. Moray East - 950MW
- **Under Construction - 1,590MW**
  8. Seagreen - 1,140MW
  9. Neart na Gaoithe - 450MW
- **Consented - 2,320MW**
  10. Moray West - 850MW
  11. Seagreen 1a - 360MW
  12. Inch Cape - 1,080MW
  13. Forthwind - 20MW
- **In Scoping - 4,100MW**
  14. Pentland Floating Offshore Wind Farm - 100MW
  15. Berwick Bank - 4,000MW
- **ScotWind Leased Projects - 24,826MW**
  16. MachairWind - 2,000MW
  17. Northland Power N1 - 840MW
  18. Magnera Offshore Wind - 495MW
  19. Northland Power N2 - 1,500MW
  20. West of Orkney Windfarm - 2,000MW
  21. Cluaran Ear-Thaigh - 1,008MW
  22. Cygnus - 1,000MW
  23. Caledonia Offshore Wind Farm - 1,000MW
  24. Orion, Floating - 500MW
  25. Floating Energy Alliance - 940MW
  26. MarramWind - 3,000MW
  27. Marra Mhàir Wind Farm - 798MW
  28. CamplonWind - 2,000MW
  29. Cluaran Deas Ear - 1,008MW
  30. Morven - 2,907MW
  31. E1 East - 2,610MW
  32. Gemini - 1,200MW
- **INTOG Areas of Search**
  33. West of Shetland-a
  34. West of Shetland-b
  35. West of Shetland-c
  36. North East-a
  37. North East-b
  38. North East-c
  39. North East-d
  40. East-a
  41. East-b
- **Floating Wind - 15,249MW**
- **Fixed Wind - 19,477MW**
- **Total - 34,726MW**

England & Wales sites.

**Offshore Wind Leasing Round 4 Preferred Projects (England, Wales and NI) - The Crown Estate**

- 1 - RWE Renewables, 1500 MW Capacity
- 2 - RWE Renewables, 1500 MW Capacity
- 3 - Green Investment Group - Total, 1500 MW Capacity
- 4 - Consortium of EnBW and BP, 1500 MW Capacity
- 5 - Offshore Wind Limited, a Joint Venture between Cobra Instalaciones y Servicios, S.A. and Flotation Energy plc, 480 MW Capacity
- 6 - Consortium of EnBW and BP, 1500 MW Capacity

**Offshore Wind Leasing Round 4 Bidding Areas (England, Wales and NI) - The Crown Estate**

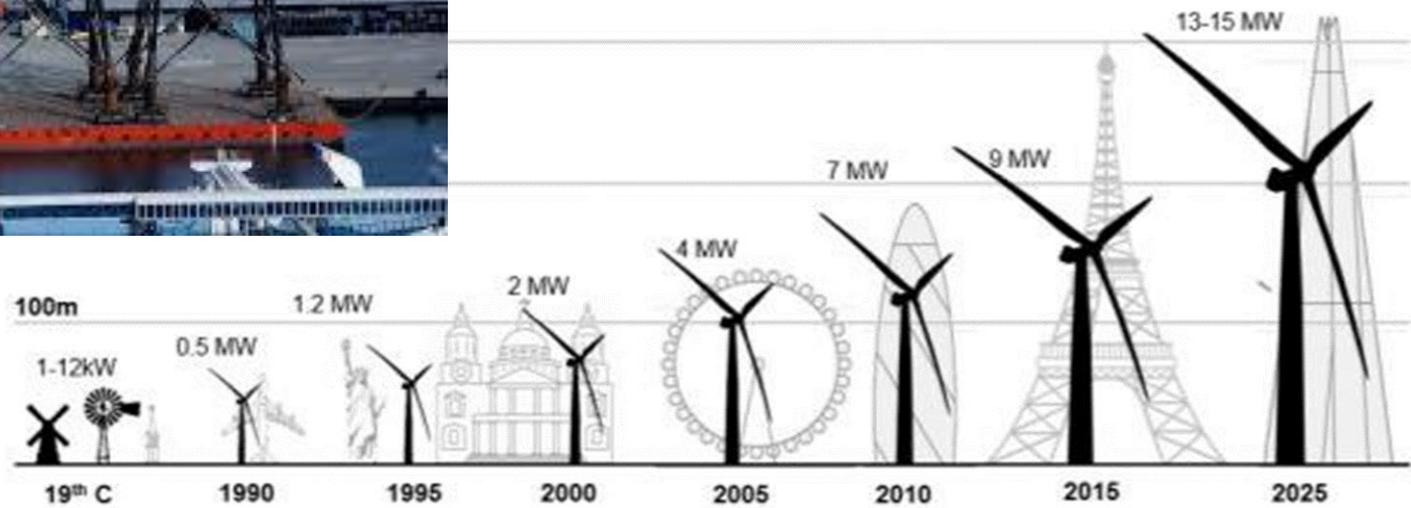

- Offshore Wind Leasing Round 4 Bidding Areas (England, Wales and NI) - The Crown Estate

**Wind Site Agreements (England, Wales & NI), The Crown Estate**

- Active/In Operation
- Under Construction
- Consented
- Government Support on Offer
- In Planning
- Pre-planning Application
- Preferred Project - Subject to HRA

# Energy Transition and Offshore Wind

---

Mamdud Hossain, PhD, SFHEA, FIMechE, CEng

Professor, Future Energy Technology

Dr Taimoor Asim, FHEA, CEng

Senior Lecturer

School of Engineering, RGU

How are we  
here?

- Climate Change Act 2008 – a binding target to reach net-zero emissions by 2050
- The Climate Change (Scotland) Act 2009 commits Scotland to a “Net Zero” emissions target of 2045. This includes a 56% reduction by 2020, 75% by 2030 and 90% by 2040 against the baseline.

# Ten Point Plan for a Green Industrial Revolution – November 2020

---

- Plan 1: Advancing Offshore Wind
  - 40 GW of Offshore Wind and 1 GW of Floating Offshore Wind by 2030
  - £20bn of private investment
  - £160 million of government investment in modern ports and manufacturing infrastructure
  - 60% UK components in Offshore Wind projects
  - Savings of 21 MtCO<sub>2</sub>e emissions between 2023 and 2032 or 5% of 2018 UK emissions

# Net Zero Strategy: Build Back Greener Oct 2021

- The policies and proposals for the power in the Net Zero Strategy will:
  - Up to 59,000 jobs in 2024 and up to 120,000 jobs in 2030
  - Additional public and private investment of £150-270bn
  - Fully decarbonise power system by 2035
  - 40 GW of offshore wind by 2030
  - 1 GW of floating offshore wind by 2030 – backed by £380 million overall funding for offshore wind

# British Energy Security Strategy – Updated April 2022

---

- Increasing the pace of deployment by 25%
- 50 GW of Offshore Wind by 2030 and 5GW of innovative floating wind
- 90,000 jobs by 2030

# Current Offshore Wind Capacity

---

- More than 10GW of cumulative installed capacity across 38 sites.
- There is a further 5GW in pre-construction,
- Plans for a further 11GW.
- Share of electricity generation: Q1-2021 -13.3% and Q1-2022 – 14.9%

## What is Offshore Wind Technology?

- After installation of Kentish Flats, an elderly couple complained in *The Times*, they could not walk the beach anymore because the wind generated by the turbines made it impossible for them to keep their balance.
- Just be clear: a turbine does not generate wind by using electricity; it generates electricity by using the wind as the energy source to turn the rotors.
- A wind farm comprises a number of wind turbines and is situated where the mean wind speed is favourable.

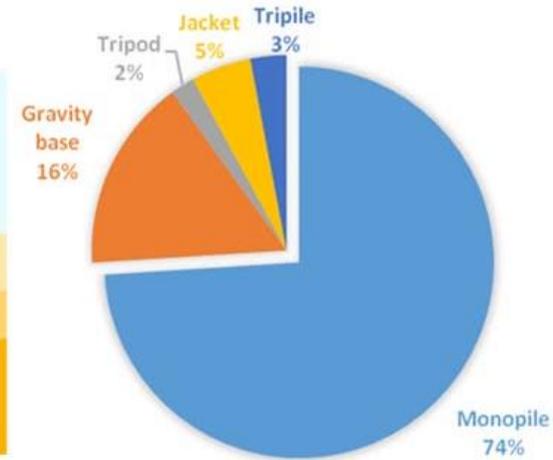

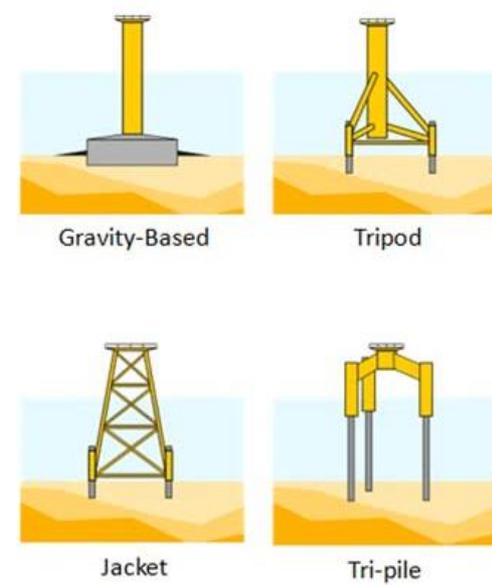

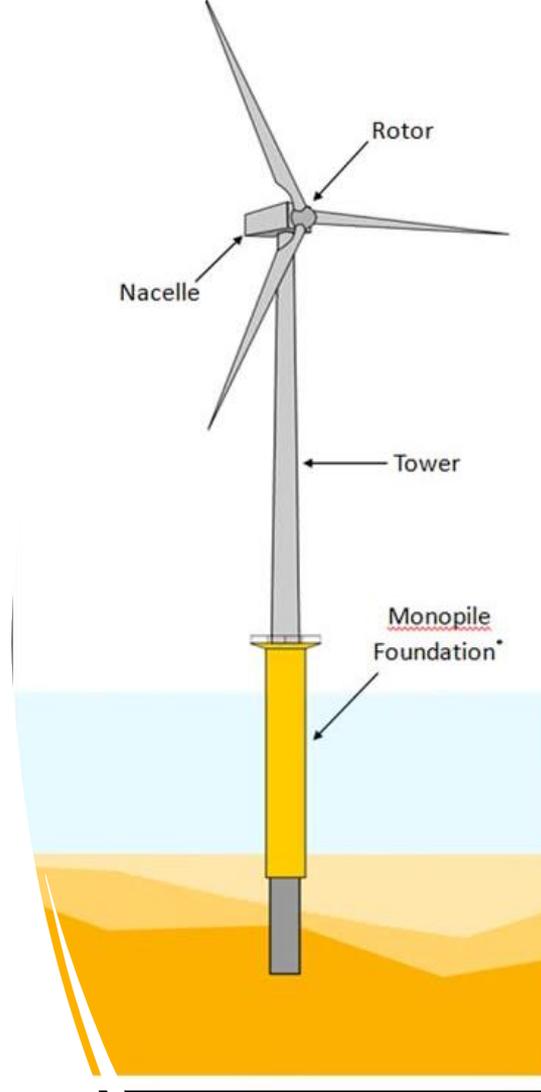

# What are the advantages and disadvantages of offshore wind power?

- Advantages:
  - Distance from local populations; cancelling worries about noise and impact on local environments
  - Space to dramatically increase the number of wind farms and thus clean energy
  - Job creation
  - Cost effective - £37/MWh
- Disadvantages:
  - Worries about the effects on birds and marine life
  - Some potential disruption during infrastructure creation

# What are components of an Offshore Wind Turbine?

- The tower
- The nacelle
- The rotor
- Foundation

# Installation of a Offshore Wind Farm

---

- The first step is to deliver components to an onshore assembly site at a harbour:
  1. Foundation
  2. Tower sections
  3. Nacelle
  4. Rotor

# Onshore Assembly

---

- No onshore assembly: all components transported and installed one-by-one at offshore
- **Tower assembly: tower sections are assembled**
- **Assembly of two blades and the nacelle**
- Assembly of three blades and the nacelle – requirement of the deck area is huge.

# Offshore transport

---

- Floating vessel stabilised with mooring lines
- Floating vessel equipped with motion compensated crane – deep water
- Jack-up barge – shallow water

# Offshore Installation

---

- Foundation installation – monopiles, jackets and tripods, gravity-based
- Turbine Installation – lifted and placed on top of foundation and bolted
  - Tower
  - Nacelle
  - Rotor
- Substation installation
  - Offshore substation – jackets or gravity based foundation, complete substation lifted and placed on the foundation
  - Onshore substation
- Cable installation
  - Array cables – 1 to 2 m under the seabed – trenching ROV
  - Export cables – buried deeper near shore – larger cable laying vessels and trenching ROV

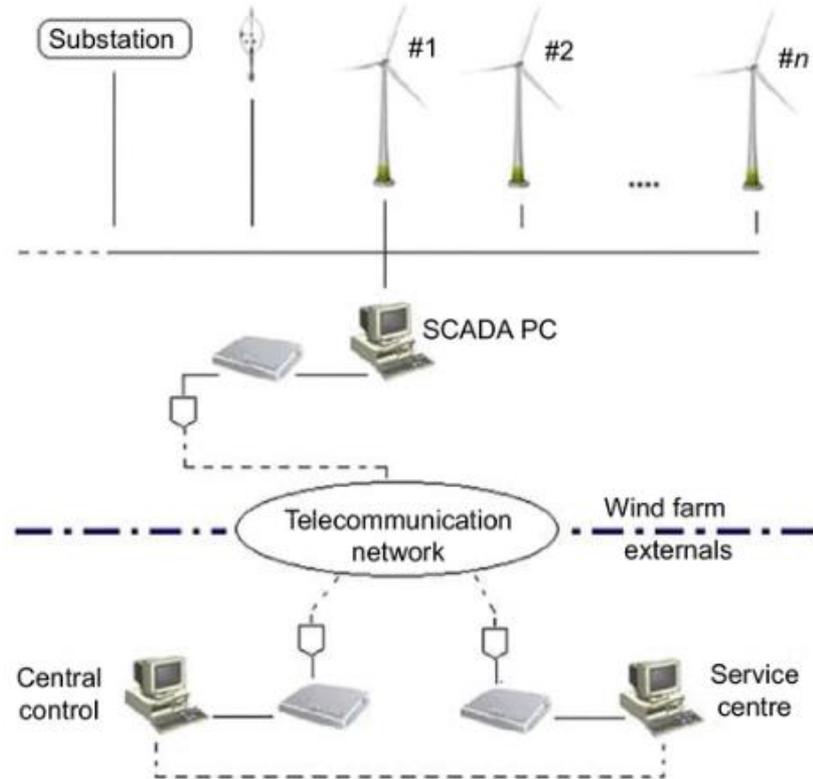

# Operation and Maintenance

- Offshore weather has significant influence of the O&M
- Offshore WT maintenance is a very young industry field – no purpose designed vessel available
- Either Wind Farm Installation vessels – oversized and not available for maintenance work
- Oil and Gas Jackup- expensive and not suitable i.e. cranes are small and legs are short

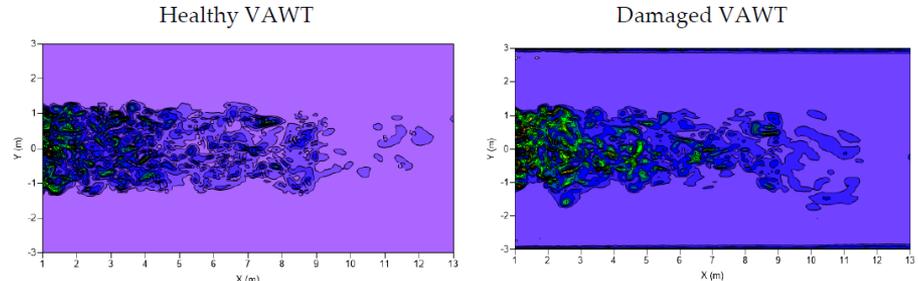

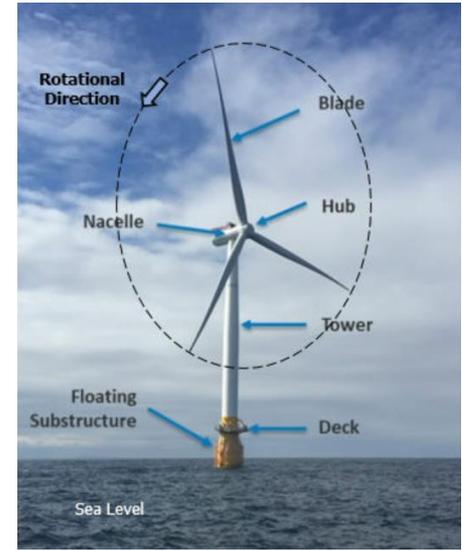

# Condition Monitoring

- The supervisory control and data acquisition (SCADA) system monitors, signals and alarms usually at 10-min intervals to reduce the transmitted data bandwidth from the wind farm.

# Wind Turbine Research at RGU

- Onshore and offshore wind turbines
- Vertical axis and horizontal axis wind turbines
- Performance Characterisation
  - Torque and power analysis
  - Healthy Vs damaged wind turbines
  - Wake dynamics
  - Blades erosion
  - Start-up dynamics (on-going)
  - Acoustic analysis
  - Proper orthogonal decomposition
  - Reduced order modelling (on-going)

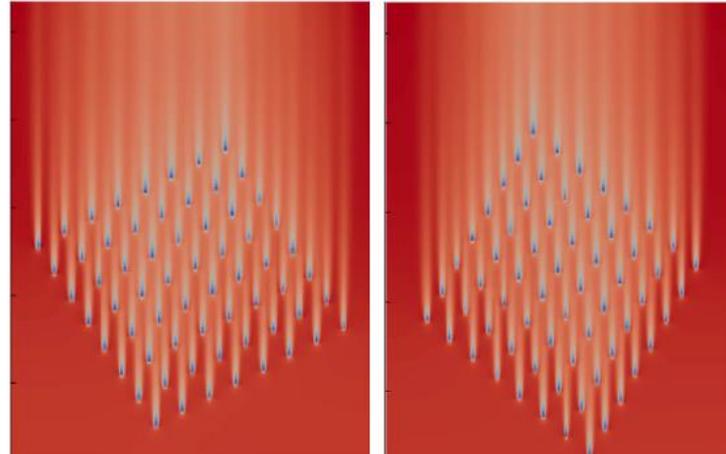

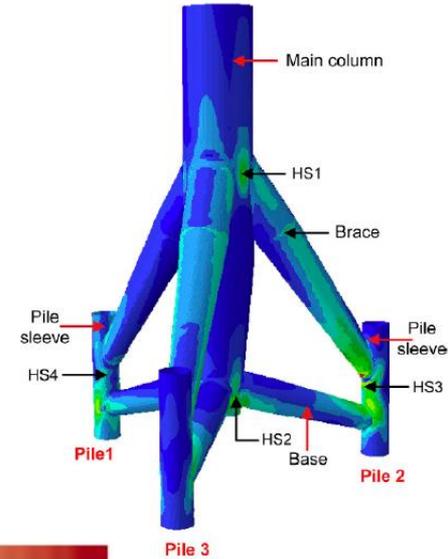

Wake dynamics (vorticity)

# Wind Turbine Research at RGU

- Structural Integrity Analysis
  - Stress-strain analysis
  - Aero-hydro-elastic analysis (on-going)
  - Goal-driven optimisation
  - Corrosion analysis
  - Monopile Vs lattice structures
  - Mooring cables VIV\*
  - Foundation/soil scouring
- Maintenance strategies
- Hydrometeorological analysis
- Wind turbine farms

\*vortex induced vibration

\* Correspondence: t.asim@rgu.ac.uk; Tel: +44-1224-262457

Abstract: Offshore wind turbines are becoming increasingly popular due to their higher wind energy harnessing capabilities and lower visual pollution. Researchers around the globe have been reporting significant scientific advancements in offshore wind turbines technology, addressing key issues,

Article

## Effects of Damaged Rotor on Wake Dynamics of Vertical Axis Wind Turbines

Taimoor Asim <sup>\*†</sup> and Sheikh Zahidul Islam <sup>†</sup>

School of Engineering, Robert Gordon University, Aberdeen AB10 7GJ, UK; s.z.islam1@rgu.ac.uk  
\* Correspondence: t.asim@rgu.ac.uk; Tel: +44-1224-262-457

Abstract: Vertical Axis Wind Turbines (VAWTs) are omnidirectional turbomachines commonly used in rural areas for small-to-medium-scale power generation. The complex flow observed in the wake region of VAWTs is affected by a number of factors, such as rotor blades design. A damaged rotor significantly alters the flow field in the wake region of the VAWT, degrading its power generation
